

Package Diagram

The purpose of the package diagram is to visibly display dependencies between high-level system components and their important relationships with one and another. In this diagram, every important page is split into packages to withhold their respective classes with class diagrams expanding on their functionalities. For instance, every package is fed into the “Procurement System User Interface” package as its the main system component holding the neighbouring packages. In other instances, the package depends on another package. For example, the “User Account” package depends on the “User Page” package due to the fact that an account needs to go through the process of registering for an account and proceeding with logging with it. This will enable the user to access the services provided by the “Procurement System User Interface” package.
